This document explains how my project could be run.

Step 1: Compile a program using command "*make*"

Step 2: Run each test by passing the command "*./straights < test'n'.in*" where n would be replaced by each number.

Detailed explanation on step 2 follows for each test cases.

- To run **test1** (n = 1) pass following command

  ./straights < test1.in

- To run **test2** (n = 2) pass following command
  "*./straights < test2.in*"

- To run **test3** (n = 2) pass following command
  ./straights < test3.in
